

Providing single sign-on in advanced mode for a Windows AD network

Using Fortinet Single Sign-On, the FortiGate unit automatically authenticates any user that successfully logs into Windows. The Domain Controller agent Advanced mode has the advantage of supporting nested or inherited user groups. If Standard mode is used, the FortiGate unit can authenticate only users who are a direct member of a group.

1. Configuring the DC agent for Advanced mode
2. Configuring the DC agent as an FSSO agent
3. Creating an FSSO user group
4. Creating an identity-based security policy
5. Results
