Preventing security certificate warnings when using SSL inspection

This example illustrates how to prevent your users from getting a security certificate error, which happens because an SSL session is established with the SSL Proxy, not the destination website. Instead of having users select *Continue* when they receive an error, a bad habit to encourage, you will provide them with the FortiGate SSL CA certificate to install on their browsers.

1. Enabling Certificate configuration in the web-based manager.

2. Downloading the Fortinet_CA_SSLProxy.

3. Importing the CA certificate into the web browser.
