

Single Sign-On access to multiple services with FortiGate and FortiAuthenticator

This example illustrates how to configure Single Sign-On (SSO) using a FortiGate and FortiAuthenticator, with the FortiAuthenticator unit acting as the SSO Agent, verifying and maintaining user login information. Users can then log in once when connecting to the internal network behind the FortiGate, and be automatically logged into servers and services that support SSO.

1. Configuring polling on the FortiAuthenticator
2. Adding a FortiAuthenticator to the FortiGate unit
3. Creating the FSSO user group
4. Creating a security policy
5. Results
