

Adding FortiToken two-factor authentication to a user account

Two-factor authentication enhances security because it requires both the user password - something that the user knows - and a dynamic token code provided by a FortiToken - something that the user has.

1. Registering FortiToken with a FortiGate unit and FortiGuard.
2. Adding two-factor authentication to the user's account.
3. Creating a policy that requires user authentication.
